Cannabis users inside and outside treatment: Similarities and differences

Roland Simon

Prevalence and patterns of drug use among
general population Indicator (GPS)
Annual expert meeting 2014, Lisbon

Data presented

- Presented:
Differences between recent cannabis users (last 12 months) and
Clients entering treatment with cannabis as main drug
- Data sources:
ESA/GPS Germany 2000 published in 2001
EBIS/TDI data Germany 2001 based on 368 outpatient facilities
- Published in
Simon et al. (2004). Cannabis Related Disorders (CARED):
Prevalence, treatment needs and provision of services in Germany
- Limitations:
GPS does not include people living in institutions
GPS does not include age groups below 18 years
Some graphs still half German
Some change in preference of substance use might have happened since 2001

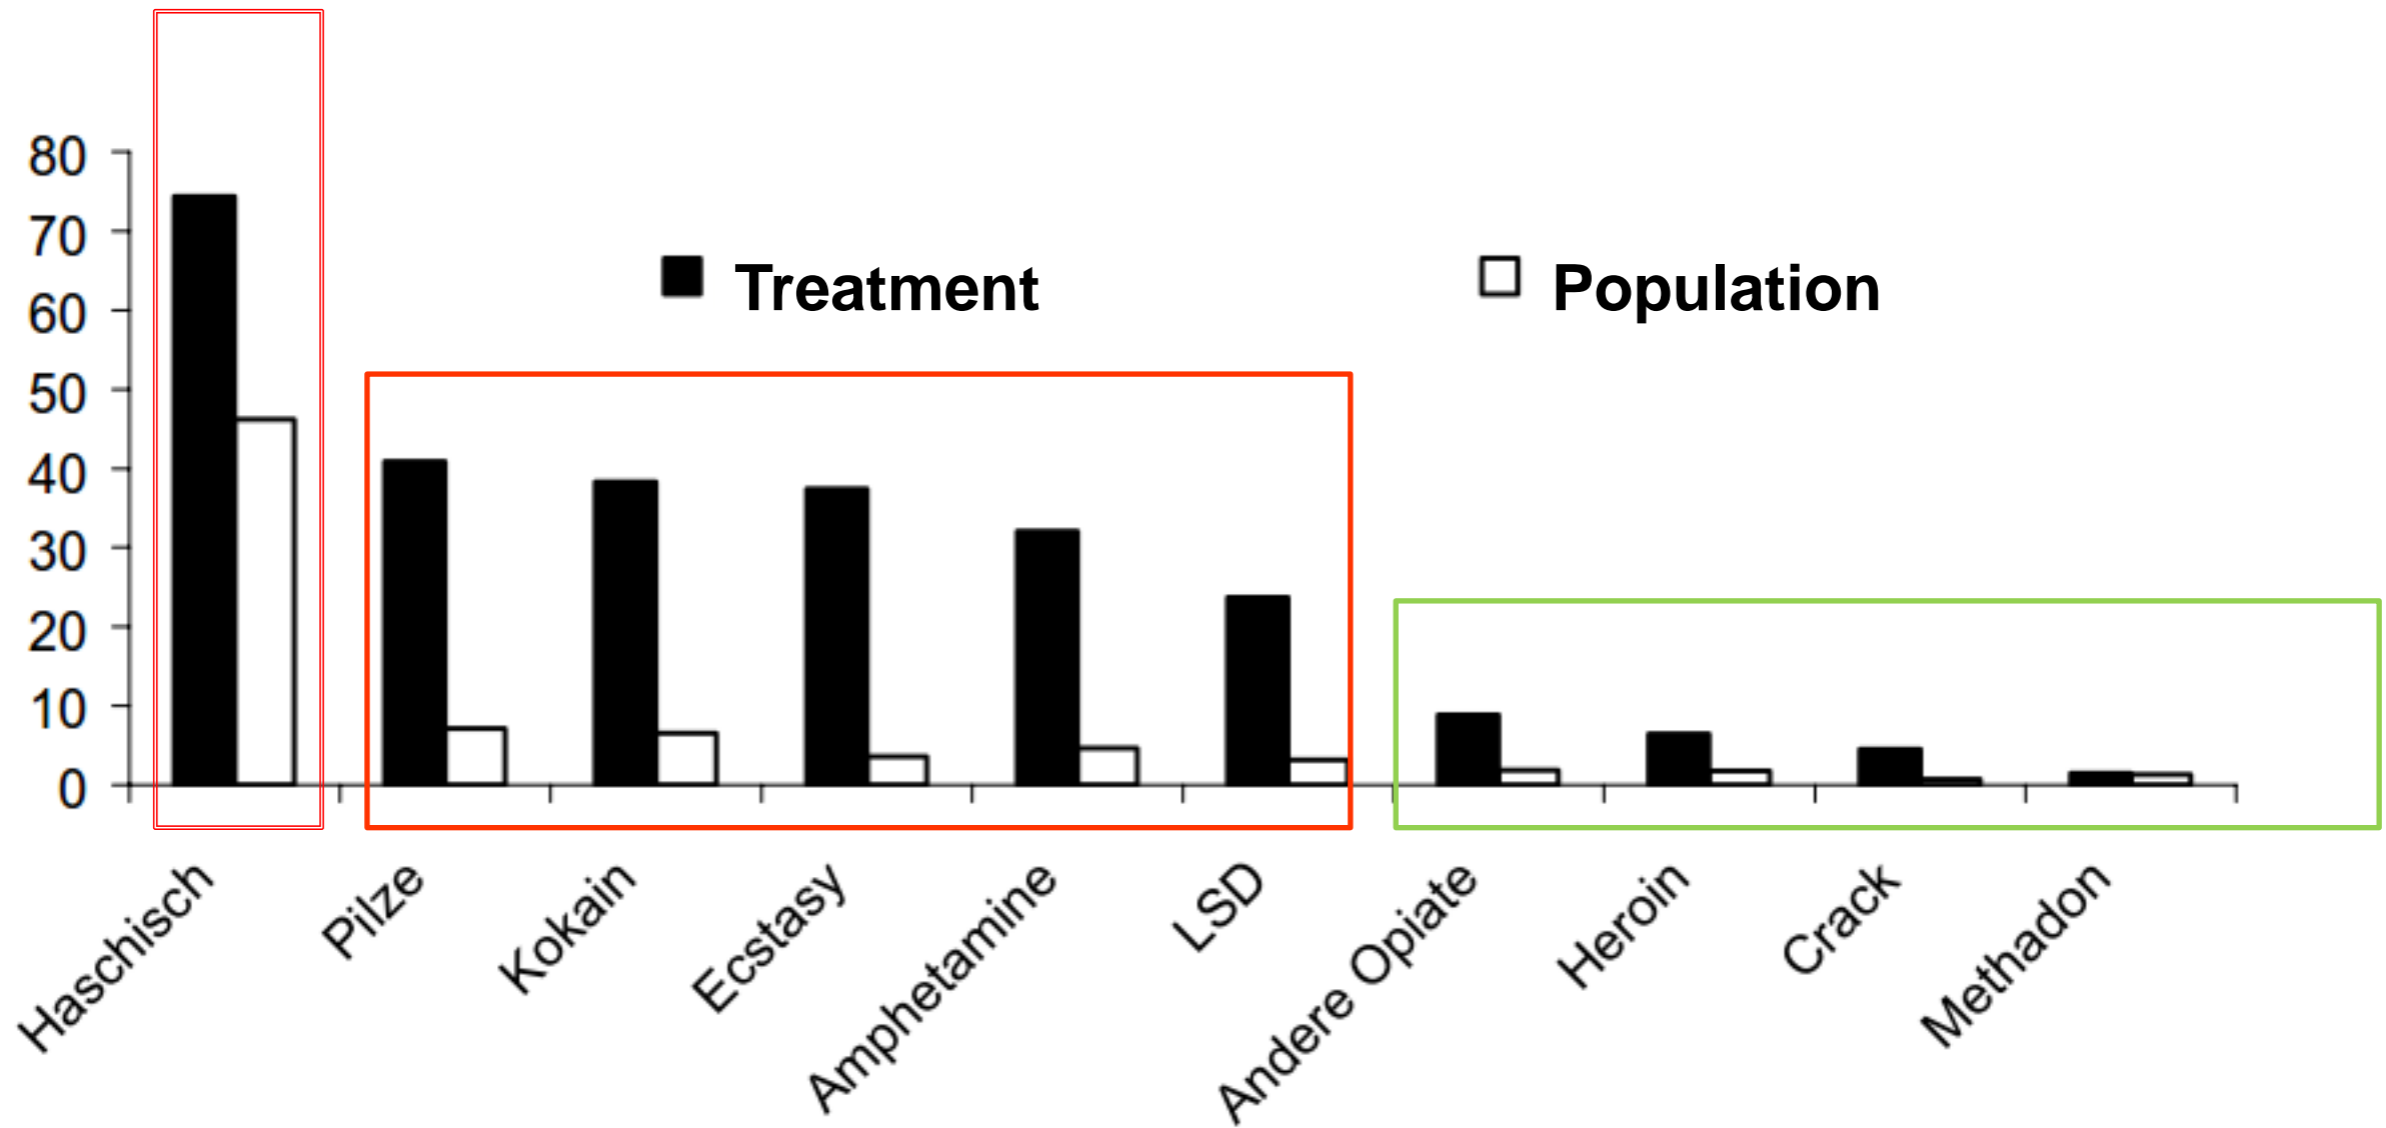

Gender

Gender	Treatment		Population	
	N	%	N	%
Male	190	86,8	313	64,5
Female	29	13,2	172	35,5
Total	223	100	486	100

Age at treatment entry

Age	Treatment		Population

Frequency of drug use during lifetime

Cannabis users vs. users seeking help

Cannabis users seeking treatment for cannabis are typically

- male
- Between 18 and 24 years
- Have started substance use early
- Often are also interested/using other substances
- have easier access to drugs – especially to hard drugs

Similarities between users and treated cases

- Clusters of substances use
 - A. Cannabis only
 - B. Cannabis/ amphetamines/ ecstasy/ cocaine/ mushrooms
 - C. Cannabis/heroin/ opioids/ crack
- Succession of drugs quite similar

Would be interesting

To analyse ...

- If this pattern is similar in other countries
- What could cause differences
- If increasing treatment availability made groups of users and clients more similar
